SUMMARY

Game Developer proficient in Unreal Engine (Blueprints/C++) and Unity (C#), focused on engineering robust, scalable core gameplay systems including advanced AI logic and dynamic rendering mechanics. Prioritizing code maintainability and execution speed to guarantee polished mechanics and high-fidelity player interaction.

EDUCATION

VIT Bhopal University, Bhopal, Madhya Pradesh

November 2022 – November 2026

Bachelor of Technology in Computer Science Engineering (Gaming Technology)

CGPA: 9.05

TECHNICAL SKILLS

Languages: C#, Blueprints, Java, HTML, CSS, Python, C++

Frameworks/Libraries/Engines: Unity, Unreal Engine

Relevant Coursework: Game Programming using Unity, Physics of Game Development, AR/VR in Gaming, Game Design using AI and ML, 3D Modelling and Animation

PROJECTS

Scalvage | *Unity 2D, C#*

December, 2024

- Engineered a 2D side-scroller one-run game using Unity, creating a seamless and engaging game play loop within 16 days for Secret Santa Game Jam 24.
- Designed pixel-art for the organ-trafficking surgeon and grotesque enemies inspired by dismembered body parts, with eerie, unnatural movements to evoke psychological horror.
- Developed a story-driven experience, immersing players in the psychological turmoil of an organ-trafficking surgeon, battling grotesque enemies like body parts and navigating through a cold, nightmare-like world.
- Scripted AI for enemies, including dismembered eyes, heads, legs, and hands, enabling dynamic, unpredictable behaviors like erratic movement patterns and reactive responses to player actions, heightening tension and immersion.

Mischief Painter: Dynamic Texture System | *Unreal Engine 5.4.4*

October, 2025 - Present

- Developed the core "Mischief Painter" mechanic for a 3D cat-simulator game, focused on causing chaos and frustrating an NPC owner.
- Engineered a real-time texture layering system using Render Targets and Material Functions to enable paint application and persistence on surfaces.
- Implemented custom shader logic to handle the accurate, seamless overlapping of multiple color swatches (red, blue, green) without blending, preserving visual fidelity and layer distinctness.
- Created an interactive tool utilizing raycasting to project paint onto the canvas, mapping 3D world interaction to 2D texture coordinates.

Third Person Game with Smart Enemy AI | *Unreal Engine 5.4.4*

September, 2025 - Present

- Building a third-person action game in Unreal Engine with melee combat (sword attacks), custom animations, and player health system using Blueprints and C++.
- Designing enemy AI using Behavior Trees, Blackboards, and AI Controllers to enable patrol, chase, and attack behaviors.
- Developing a basic HUD to display player and enemy health, integrating game play logic with clean UI feedback.

ADDITIONAL INFORMATION

Member of VR and Gaming Club: Volunteered and helped in orchestrating multiple events like, project showcasing, creating an interest in high school students to pursue game development and freshers' orientation in the VRGC Club.

Blender: Proficient in making 3D modles in Blender 4.3.

Video Games: 700+ hours of gameplay experience fueling insights into game design, mechanics, and player behavior.
